کد نویسی با جاوا اسکریپت

منبع:

 Ostad Online
training on the web

بنام یگانه ی هستنی بخش

یکی از ابزارهای قدرتمند در طرح و ایجاد صفحات زیبای وب Java Script می باشد . همگان می دانیم که استفاده از HTML بدون ابزارهای قدرتمند دیگر در دنیای امروزی عملاً مطرود گردیده است . حالا با توجه به این مهم بر آن شدیم تا بدون پرداختن به جزئیات برنامه نویسی Java Script تعدادی از این کدها را با ذکر عملی که انجام می دهند گردآوری کنیم که امیدواریم مورد استفاده کاربران محترم قرار گیرد . ضمناً منتظر ارائه نظرات و پیشنهادات شما از طریق آدرسهای الکترونیکی vlearning@etvto.ir و bszarabian@etvto.ir هستیم .

بیبا ضرابیان

فصل اول

موضوع اسکرپت کنترل بر رمز ورودی

این اسکرپت زمانی کاربرد دارد که شما یک Max Length برای فیلد ورودی Password تعریف کنید در اینصورت اگر تعداد کاراکترهای وارد شده از حداقل آن عدد تعریف شده کمتر باشد پیام خطا ظاهر می شود ضمناً اگر کاراکترهای دو میدان ورودی Password و تایید آن با هم ناهمخوان باشند پیام خطا ظاهر می شوند .

<!-- TWO STEPS TO INSTALL VALIDATION (PASSWORD):

1. Copy the coding into the HEAD of your HTML document
2. Add the last code into the BODY of your HTML document -->

<!-- STEP ONE: Paste this code into the HEAD of your HTML document -->

<HEAD>

<SCRIPT LANGUAGE="JavaScript">

<!-- This script and many more are available free online at -->

<!-- The JavaScript Source!! <http://www.ostadonline.com> -->

<!-- Begin

```
function validatePwd() {
var invalid = " "; // Invalid character is a space
var minLength = 6; // Minimum length
var pw1 = document.myForm.password.value;
var pw2 = document.myForm.password2.value;
// check for a value in both fields.
if (pw1 == "" || pw2 == "") {
alert('Please enter your password twice.');
```

```

}
else {
if (pw1 != pw2) {
alert ("You did not enter the same new password twice. Please re-enter your
password.");
return false;
}
else {
alert('Nice job. ');
return true;
}
}
}
// End -->
</script>
</HEAD>

```

<!-- STEP TWO: Copy this code into the BODY of your HTML document -->

<BODY>

<center>

<form name=myForm onSubmit="return validatePwd()">

Enter your password twice.

(At least 6 characters, 12 characters max, and spaces are not allowed.)

<p>

Password: <input type=password name=password maxlength=12>

Verify password: <input type=password name=password2 maxlength=12>

<p>

<input type=submit value="Submit">

</form>

</center>

<p><center>

موضوع اسکرپت موافقت قبل از ورود اطلاعات

این اسکرپت در زمانی کاربرد دارد که دو کلید رادیویی مربوط به موافقت و یا عدم موافقت داشته باشید. در اینصورت اگر شما کلید موافقت را اعلام کنید در Box مربوطه می توانید اسم خود را وارد و یا تغییر دهید در غیر اینصورت Box قفل شده و شما حق نوشتن و یا تغییرات را در آن ندارید

. این مورد بیشتر برای مواقعی کاربرد دارد که مسئول سایت تعهدی در قبال ضرری که بازدید کننده از خرید نرم افزار یا هر چیز دیگری متضمن می شود را ندارد .

```
<!-- TWO STEPS TO INSTALL AGREE BEFORE ENTRY:
```

1. Copy the coding into the HEAD of your HTML document
2. Add the last code into the BODY of your HTML document -->

```
<!-- STEP ONE: Paste this code into the HEAD of your HTML document -->
```

```

2. Add the last code into the BODY of your HTML document -->

```
<!-- STEP ONE: Paste this code into the HEAD of your HTML document -->
```

```
<HEAD>
```

```
<SCRIPT LANGUAGE="JavaScript">
```

```
<!-- Changes:
```

```
/* 1.1.4: Fixed a bug where upper ASCII characters (i.e. accented letters international characters) were allowed.
```

1.1.3: Added the restriction to only accept addresses ending in two letters (interpreted to be a country code) or one of the known TLDs (com, net, org, edu, int, mil, gov, arpa), including the new ones (biz, aero, name, coop, info, pro, museum). One can easily update the list (if ICANN adds even more TLDs in the future) by updating the knownDomsPat variable near the top of the function. Also, I added a variable at the top of the function that determines whether or not TLDs should be checked at all. This is good if you are using this function internally (i.e. intranet site) where hostnames don't have to conform to W3C standards and thus internal organization e-mail addresses don't have to either.

Changed some of the logic so that the function will work properly with Netscape 6.

1.1.2: Fixed a bug where trailing . in e-mail address was passing (the bug is actually in the weak regexp engine of the browser; I simplified the regexps to make it work).

1.1.1: Removed restriction that countries must be preceded by a domain, so abc@host.uk is now legal. However, there's still the restriction that an address must end in a two or three letter word.

1.1: Rewrote most of the function to conform more closely to RFC 822.

```

1.0: Original */
// -->

<!-- Begin
function emailCheck (emailStr) {

/* The following variable tells the rest of the function whether or not
to verify that the address ends in a two-letter country or well-known
TLD. 1 means check it, 0 means don't. */

    setTimeout("flipflop()",pause);

}

else {

    setTimeout("flipflop()",rate);

}

}

else {

    var ht = document.getElementById("pic").getAttribute("height");

    ht = ht - inc;

    document.getElementById("pic").setAttribute("height",ht);

    if (ht==wdmin) {

        document.getElementById("pic").setAttribute("src","pic1.gif"); //substitute name of
your first picture

        inc=-inc;

    }

    if (ht==wdmax) {

```

```

ff="flip";

inc=-inc;

setTimeout("flipflop()",pause);

}

else {

setTimeout("flipflop()",rate);

}

}

}

-->

</SCRIPT>

</HEAD>

<!-- STEP TWO: Insert the onLoad event handler into your BODY tag -->

<BODY onLoad="javascript:flipflop()">

<!-- STEP THREE: Copy this code into the BODY of your HTML document -->

<center>

<TABLE border="0">

<th width="160" height="160">

<IMG src="http://www.ostadonline.com/img/network/hub.jpg" width="120"
height="120" ID="pic">

</th></TABLE>

```

<p>This script alternately "flips" and "flops" between two images, with adjustable smoothness, speed and pauses. It may be useful as an alternative to a crossfade, where you want to create movement to attract attention, or where you want to show

two images with equal prominence that don't necessarily look well together (I wrote it to show two dissimilar corporate logos). Small images are less taxing on system resources and will appear smoother in operation.

It is important that:

- The two images are square and of the same size, and
- The difference between `wdmax` (maximum width of square image) and `wdmin` (minimum thickness edge-on image) is an exact multiple of `inc` (the step change); otherwise the image will flip once and disappear.

If only requiring movement in one direction, set the "ff" variable to it, and delete or change the

subsequent resetting of this variable accordingly.
